

Triggers

Write a PL/SQL trigger to restrict the insert/update/delete operations on a table.

Assume our DB has a relation schema :Pfessor (pNum, pName, salary) create a trigger to ensure that any new professor inserted has salary ≥ 60000 .

Create a backlog table for professor to store deleted professor details. Manage the operation using trigger.

Maintain a Gold Price History table using trigger.

```
create table gold(cdate date,price int);
```

```
create table pricehistory(odate date,price int);
```

```
insert into gold values(sysdate,30000);
```

```
create or replace trigger s2
```

```
after update on gold
```

```
for each row
```

```
begin
```

```
insert into pricehistory values(:old.cdate,:old.price);
```

```
end;
```

```
/
```

```
update gold set price=90000,cdate=sysdate;
```
